

AMENDMENTS TO THE CLAIMS

1. (Previously presented) A surface radiation conversion element for converting electromagnetic wave, which is radiated from a radiation source, to surface radiation, characterized in that an element body has a generally plate shape constituted with a material having a larger electric permittivity than air outside said element body and, in the inside of the element body, a plurality of closed spaces are disposed whose electric permittivity is smaller than that of the material constituting the element body and whose surfaces opposite to a radiation surface are generally flat.

2. (Original) The surface radiation conversion element according to claim 1, characterized in that a plurality of closed spaces are disposed whose surfaces opposite to said radiation surface are generally parallel to the radiation surface.

3. (Original) The surface radiation conversion element according to claim 1, characterized in that a plurality of closed spaces are adjacently disposed whose surfaces opposite to said radiation surface are generally parallel to each other.

4. (Original) The surface radiation conversion element according to claim 1, characterized in that a first member having a radiation source disposed on a side thereof and a second member disposed on the radiation surface side are constituted to be in close adhesion, and said closed spaces are formed between said first member and said second member.

5. (Original) The surface radiation conversion element according to claim 4, characterized in that at least one member of said first member and said second member has recesses formed therein, and said recesses are disposed to constitute said closed spaces by joining the first member and the second member.

6. (Original) The surface radiation conversion element according to claim 1, characterized in that a total reflection restraining layer such as a scattering layer is disposed in the radiation surface.

7. (Original) The surface radiation conversion element according to claim 1, characterized in that said closed spaces are filled with solid layers having a smaller electric permittivity than the material constituting the element body.

8. (Currently amended) A liquid crystal display device having a surface radiation conversion element, characterized in that an element body of the surface radiation conversion element has a generally plate shape constituted with a material having a larger electric permittivity than air outside said element body and, in the inside of the element body, a plurality of closed spaces are disposed whose electric permittivity is smaller than that of the material constituting the element body and whose surfaces opposite to a radiation surface are generally flat.

9. (Original) The liquid crystal display device according to claim 8, characterized in that a plurality of closed spaces are disposed whose surfaces opposite to said radiation surface are generally parallel to the radiation surface.

10. (Original) The liquid crystal display device according to claim 8, characterized in that a plurality of closed spaces are adjacently disposed whose surfaces opposite to said radiation surface are generally parallel to each other.

11. (Original) The liquid crystal display device according to claim 8, characterized in that a first member having a radiation source disposed on a side thereof and a second member disposed on the radiation surface side are constituted to be in close adhesion, and said closed spaces are formed between said first member and said second member.

12. (Original) The liquid crystal display device according to claim 8, characterized in that at least one member of said first member and said second member has recesses formed therein, and said recesses are disposed to constitute said closed spaces by joining the first member and the second member.

13. (Original) The liquid crystal display device according to claim 12, characterized in that a total reflection restraining layer such as a scattering layer is disposed in the radiation surface.

14. (Original) The liquid crystal display device according to claim 8, characterized in that said closed spaces are filled with solid layers having a smaller electric permittivity than the material constituting the element body.

Claim 15 (Cancelled).

16. (Previously presented) The method of producing a surface radiation conversion element according to claim 20, characterized in that

said first member is constituted with a plate material such as an acrylic light guide,
said second member is constituted with a sheet member such as a diffusion sheet containing polycarbonate as a principal material, and
said first member and said second member are joined by adhesion.

17. (Previously presented) The method of producing a surface radiation conversion element according to claim 20, characterized in that said recesses are formed in one member of the first member and the second member, and a joining surface of the other member to which the one member having said recesses formed therein is joined is formed to be generally coplanar.

18. (Previously presented) The method of producing a surface radiation conversion element according to claim 20, characterized in that a total reflection restraining layer such as a

diffusion layer is formed in said first member or said second member in a surface opposite to the joining surface.

Claim 19 (Cancelled).

20. (Previously presented) A method of producing a surface radiation conversion element for converting electromagnetic radiation from a radiation source to surface radiation, comprising the steps of:

providing a first member having a first electric permittivity and a second member having a second permittivity generally equal to the first electric permittivity, wherein a plurality of recesses are formed in a surface of at least one of the first member and the second member;

connecting the second member to the first member to close the recesses;

whereby the recesses have a smaller electric permittivity than the first electric permittivity and the second electric permittivity.

21. (Previously presented) The method of claim 20 including the additional step of filling the recesses with a solid material having an electric permittivity less than the first electric permittivity.

22. (Previously presented) The method of claim 20 including the additional step of filling the recesses with a gas having an electric permittivity less than the first electric permittivity.

23. (New) The surface radiation conversion element according to claim 1, characterized in that a first member having a radiation source disposed on a side thereof and a second member disposed on a radiation surface of the first member are constituted to be in close adhesion, the second member including a planar surface having a plurality of openings therein, wherein face contact between the second member planar surface and the first member closes the spaces in the second member.

24. (New) The liquid crystal display device according to claim 8, characterized in that a first member having a radiation source disposed on a side thereof and a second member disposed on a radiation surface of the first member are constituted to be in close adhesion, the second member including a planar surface having a plurality of openings therein, wherein face contact between the second member planar surface and the first member closes the spaces in the second member.

25. (New) A surface radiation conversion element for converting electromagnetic wave, which is radiated from a radiation source, to surface radiation, comprising an element body having a generally plate shape constituted with a material having a larger electric permittivity than air outside said element body and, in the inside of the element body, a plurality of closed spaces are disposed, the electric permittivity of said closed spaces being smaller than the electrical permittivity of the material constituting the element body,

wherein said element body comprises a first member having a first side facing a radiation source and a planar second side and a second member having a planar side having a plurality of openings having generally flat bottoms, said second member being mounted on said first member with portions of said second member planar side in face contact with said first member planar second side thereby closing said plurality of openings.
